

Goal& Brain Storm

Goal of game: Stress relief game that is for college student

Brain storm:

Want something 3d, not too much time consuming, fun, can release stress

Ask Gemini: What are some activities that you would suggest if I was a college student who deals with stress?

Movement-Based Stress Relief

Sometimes the best way to get out of your head is to get into your body.

The "No-Judgment" Walk: Leave the headphones behind. Just walk around campus or a local park for 15 minutes. Noticing the environment helps ground you in the present moment.

Intramural Sports or Yoga: Most campuses offer free or cheap classes. Yoga is great for regulated breathing, while something like dodgeball is great for... venting frustration.

Progressive Muscle Relaxation: While sitting at your desk, tense and then release each muscle group starting from your toes up to your jaw.

Creative & Mental Resets

You spend all day using the "analytical" side of your brain; give the "creative" side some airtime.

Low-Stakes Creating: Grab a coloring book, some clay, or even just doodle during a lecture. The goal isn't "art"—it's the tactile rhythm of doing something with your hands.

Brain Dumping: Set a timer for 5 minutes and write down every single thing stressing you out. Once it's on paper, your brain doesn't have to work as hard to "remember" to be stressed about it.

Guided Imagery: Close your eyes and visualize a place where you feel completely safe. Research shows your brain reacts to these mental images similarly to real-life experiences.

Social & Environmental Shifts

Your environment heavily dictates your internal state.

The "Study-Free" Zone: Designate one spot (like a specific coffee shop or a corner of the library) where you **never** do schoolwork. Go there only to read for fun or scroll your phone.

Body Doubling: If chores or easy assignments are piling up, sit with a friend while you both work silently. Just having another human nearby can lower cortisol levels.

Animal Therapy: Many campuses bring in therapy dogs during finals, but even visiting a local shelter or watching bird feeders can lower your heart rate.

Following prompt: I want to go down the creative options and what types of game would you suggest to play.

Game Recommendations for Stress

Depending on how your stress manifests, you might want something "cozy" to relax or something "flow-based" to distract you.

The "Cozy & Chill" (Low Stakes)

- **Stardew Valley / Animal Crossing:** The gold standard for stress relief. There are no "Game Over" screens. You just farm, fish, and talk to cute neighbors. It provides a sense of routine and accomplishment that school often lacks.
- **Unpacking:** A literal puzzle game about unpacking boxes and putting items on shelves. It's incredibly satisfying, quiet, and tells a story through objects without any dialogue.
- **Dorfromantik:** A peaceful building strategy and puzzle game where you create a beautiful, ever-growing village landscape by placing tiles.

The "Brain-Hacker" (High Focus/Flow)

- **Tetris Effect:** The music and visuals react to your movements. It's designed to put you into a "flow state" where the rest of the world disappears.
- **PowerWash Simulator:** It sounds like a joke, but it's one of the most relaxing games ever made. Seeing something go from filthy to clean provides an immediate hit of dopamine and a sense of control.
- **Mini Metro:** You design subway maps for growing cities. It's minimalist, clean, and starts very slowly, allowing you to focus on simple geometry and efficiency.

Ok I like the "Cozy&Chill" low stake types of games.

Games like Stardew Valley/Animal crossing (you just farm,fish, and talk to cute neighbors)

Theme: Gardening game, Paint ground game, fishing game,

Prompt: ok I like the cozy & chill games like stardew valley and animal crossing. what are those types of games and give me a short list to refer to

Those types of games are officially known as **"Cozy Games"** or **"Life Sims"** (Life Simulations).

The magic of these games lies in **low stakes**—there are no ticking clocks that lead to a "Game Over," and you generally can't "lose." They focus on gentle progression, decorating, and building relationships, which makes them the perfect antidote to college stress.

List: The "Modern Classics" (Most similar to Stardew/AC)

- Fields of Mistria
- Disney Dreamlight Valley
- Sun Haven

The "Focus & Decorate" (Less farming, more chill)

- Unpacking
- Tiny Life
- Animal Crossing: New Horizons (DLC - Happy Home Paradise)

The "Cozy with a Twist"

- Moonlight Peaks
- Spiritfarer
- Cult of the Lamb

Great for Mobile (Good for between classes)

- Hello Kitty Island Adventure
- Tsuki's Odyssey

I want to be 3D and 2D can be time consuming for fundamental development.

From your list, these are the games that are **3D**:

- **Disney Dreamlight Valley**
- **Animal Crossing: New Horizons** (and its DLC)
- **Moonlight Peaks**
- **Hello Kitty Island Adventure**

Prompt: can you give me a another list of 3d game that are in this genre

- Starsand Island
- Coral Island
- My Time at Evershine
- Fae Farm
- Wylde Flowers
- Dinkum
- Grow: Song of the Evertree
- Slime Rancher 2

- Loftia
- Infinity Nikki
- Palworld (Palfarm)
- Ooblets

The games engine we are going to be using is Unity. We chose this game engine because it can port the game file into whatever platform we chose later on and it has the largest community. Which means we can port the game to PC, Console, Mobile, Nintendo, and Browser. In addition, our team already has some experience with it so we aren't stepping in completely new lands and their lot of other resources online to assist us on issues.

Gardening Game where players login every day to plan fruits, vegetables, flowers, and additional goods. Games objective it to grow crops and keep growing farms and updating the farm home.

prototype

Prototype- build a working prototype of a gardening game

Load a URP file in Unity game engine

Get up basic character movement, camera movement, farm land, functionality of crops, and location to sell crops and update system for farm house and save game state.

Prompt basic camera: using UnityEngine;

```
public class CameraFollow : MonoBehaviour
{
    public Transform target;    // Drag player here
    public Vector3 offset = new Vector3(0, 10, -5); // Position relative to player
    public float smoothSpeed = 0.125f;

    void LateUpdate()
    {
        if (target == null) return;

        // Desired position based on the player's current spot
        Vector3 desiredPosition = target.position + offset;

        // Smoothly interpolate between current position and desired position
        Vector3 smoothedPosition = Vector3.Lerp(transform.position, desiredPosition,
smoothSpeed);

        transform.position = smoothedPosition;

        // Optional: Ensure the camera is always looking at the player
        // transform.LookAt(target);
    }
}
```

Prompt movement:

using UnityEngine;
using UnityEngine.AI;

```
public class PlayerMovement : MonoBehaviour
{
    private NavMeshAgent agent;

    void Start()
```

```

{
    agent = GetComponent<NavMeshAgent>();
}

void Update()
{
    // Check for left mouse click
    if (Input.GetMouseButtonDown(0))
    {
        Ray ray = Camera.main.ScreenPointToRay(Input.mousePosition);
        RaycastHit hit;

        // Cast a ray to see where the mouse clicked in the 3D world
        if (Physics.Raycast(ray, out hit))
        {
            // Move the agent to the clicked position
            agent.SetDestination(hit.point);
        }
    }
}
}

```

Very barren even with functionality. And some values are way off and make the game look weird. I had to go around changing the position of the camera and visual indicator to show more interest. Fundamentally needs for the player are met with movement and camera. Now to move to other fundamentals such as the farm and gardening.

An application known as probuilder was recommended by Gemeini afterwards with a little tutorial we managed to get something small and looking like a garden.

Prompt: Im trying to create a gardening game where the player is a cute humaniod rabbit can you generate an image of just the character

Prompt: can you extract the character and just make a style sheet with character t-posing please.

CHARACTER REFERENCE: GARDENER RABBIT

Prompt: In this art style can I get a image of a cabbage, radish, strawberry, and carrot

We used Meshy.Ai to generate the 3d model after clean up image:

Select the best image generated. And added textures to make it look better.

I went into 3d modeling software called blender to extract texture. And make sure asset can get imported into the game.

Prompt: can you give me a cute rabbit house in that style

Prompt: I just want the house now

Added all the assets and models

In game style showcase.

I have to sort out animation for walking rabbits. Add vegetables and functionality.

Can you create a starter menu for this game?

Same menu with player inside.

Create a script for player to interact with plant for now just cabbage

```
using UnityEngine;

public class HarvestZone : MonoBehaviour
{
    public GardenManager gardenManager;

    // This runs even if the "Player" tag is wrong
    private void OnTriggerEnter(Collider other)
    {
        Debug.Log("!!! TRIGGER DETECTED !!! Interacted with: " +
other.name);

        if (other.CompareTag("Player"))
        {
            Debug.Log("Tag is correct. Sending command to
GardenManager...");
            if (gardenManager != null)
            {
                gardenManager.HarvestAll();
            }
            else

```

```

        {
            Debug.LogError("GARDEN MANAGER IS MISSING FROM THE
SLOT!");
        }
    }
    else
    {
        Debug.LogWarning("Object touched me, but its tag is: " +
other.tag);
    }
}
}
}

```

```

using UnityEngine;
using System.Collections;

public class GardenManager : MonoBehaviour
{
    public GameObject cabbagePrefab;
    public Transform[] plantLocations;
    public float respawnTime = 5.0f; // Public variable for cooldown in
seconds

    private GameObject[] spawnedPlants; // Keep track of the actual plants

    void Start()
    {
        spawnedPlants = new GameObject[plantLocations.Length];
        SpawnInitialCabbages();
    }

    void SpawnInitialCabbages()
    {
        for (int i = 0; i < plantLocations.Length; i++)
        {
            spawnedPlants[i] = Instantiate(cabbagePrefab,
plantLocations[i].position, plantLocations[i].rotation,
plantLocations[i]);

```

```

    }

}

// This is called by the HarvestBox
public void HarvestAll()
{
    // Only harvest if the first plant is active (prevents
double-harvesting during cooldown)
    if (spawnedPlants[0].activeSelf)
    {
        foreach (GameObject plant in spawnedPlants)
        {
            plant.SetActive(false);
        }

        Debug.Log("Harvested! Starting cooldown...");
        StartCoroutine(RespawnRoutine());
    }
}

IEnumerator RespawnRoutine()
{
    yield return new WaitForSeconds(respawnTime);

    foreach (GameObject plant in spawnedPlants)
    {
        plant.SetActive(true);
    }
    Debug.Log("Plants have grown back!");
}
}

```

Added a script for all plants

Went back to the player and wanted to add some animations. Went to a site called mixamo where we can import the character and after some tweaking rig and animate it to a set of predefined animations. Select the best animations and import to unity and add to

character.

Set up the animation :

Set up the economy system: using UnityEngine;

```
using System.Collections;
using TMPro; // 1. IMPORTANT: Add this to use TextMeshPro

public class GardenManager : MonoBehaviour
{
    public enum PlantType { Cabbage, Radish, Straw, Carrot }
```

```

[Header("Patch Configuration")]
public PlantType plantType;
public int harvestValue = 24;
public float respawnTime = 5.0f;

[Header("UI Reference")]
public TextMeshProUGUI countText; // 2. Drag your specific TMP text
here

[Header("Prefabs")]
public GameObject plantPrefab;

[Header("Locations")]
public Transform[] plantLocations;

private GameObject[] spawnedPlants;
private bool isGrowing = false;

void Start()
{
    spawnedPlants = new GameObject[plantLocations.Length];
    SpawnInitialPlants();

    // Update the UI immediately on start so it doesn't show
placeholder text
    UpdateUIText();
}

void SpawnInitialPlants()
{
    for (int i = 0; i < plantLocations.Length; i++)
    {
        spawnedPlants[i] = Instantiate(plantPrefab,
plantLocations[i].position, plantLocations[i].rotation,
plantLocations[i]);
    }
}

public void HarvestAll()
{

```

```

        if (!isGrowing && spawnedPlants[0].activeSelf)
        {
            foreach (GameObject plant in spawnedPlants)
            {
                plant.SetActive(false);
            }

            AddInventory();
            StartCoroutine(RespawnRoutine());
        }
    }

    void AddInventory()
    {
        string saveKey = "Saved" + plantType.ToString();
        int currentTotal = PlayerPrefs.GetInt(saveKey, 0);
        currentTotal += harvestValue;

        PlayerPrefs.SetInt(saveKey, currentTotal);
        PlayerPrefs.Save();

        // 3. Update the UI right after saving
        UpdateUIText();
    }

    // This helper function keeps the UI in sync with the save data
    void UpdateUIText()
    {
        if (countText != null)
        {
            {
                string saveKey = "Saved" + plantType.ToString();
                int currentTotal = PlayerPrefs.GetInt(saveKey, 0);

                // This now ONLY shows the number
                countText.text = currentTotal.ToString();
            }
        }
    }

    IEnumerator RespawnRoutine()

```

```

{
    isGrowing = true;
    yield return new WaitForSeconds(respawnTime);

    foreach (GameObject plant in spawnedPlants)
    {
        plant.SetActive(true);
    }
    isGrowing = false;
}
}

```

Update the visual and landscape:

Generate coin asset and edit to get final result which I uploaded to the gamefile:

Added menu screen and buttons for functionality and now finished.

```
using UnityEngine;
using UnityEngine.SceneManagement; // Required for loading scenes

public class StartUp : MonoBehaviour
{
    [Header("Scene Settings")]
    public string gameSceneName = "FarmScene"; // The name of your main
game scene
    public string menuSceneName = "StartMenu"; // The name of your menu
scene

    // 1. START BUTTON: Call this to go to the game
    public void StartGame()
    {
        Debug.Log("Loading Game...");
        SceneManager.LoadScene(gameSceneName);
    }

    // 2. BACK BUTTON: Call this to return to the menu
    public void ReturnToMenu()
```

```
{  
    Debug.Log("Returning to Main Menu...");  
    SceneManager.LoadScene(menuSceneName);  
}  
  
// 3. EXIT BUTTON: Quits the application  
public void ExitGame()  
{  
    Debug.Log("The rabbit has left the garden. (Game Exited)");  
  
    // This only works in a built game (.exe), not in the Unity Editor  
    Application.Quit();  
}  
}
```

Lately I went to Pixbay to get some copy right free music and added it to the game.
